

Project Managers

About the job

Our Vancouver-based client is looking for project managers who can use their experience implementing packaged software to deliver our client's industry-leading ESP software product. Your role will encompass leading our client's implementation teams through the complete software delivery cycle, from analysis through to support. You will also be responsible for project planning and estimating.

Your primary objective will be to ensure that our client delivers on-time and on-budget while also establishing and maintaining effective client relationships. Given the nature of the product and our client's desire to refine it continually over time, establishing sincere, long-term relationships with our customers is critical to their future success as well as our client's. You will be a key player in this feedback loop and in working with our client's customers to identify future business opportunities.

About our client

Our client is a dynamic and growing company that's grown 300% in the past year alone. Their products help asset-intensive organizations around the world manage the challenges of aging infrastructure by completely restructuring their approach to capital planning, life-cycle asset planning, and budgeting. They call their unique methodology *asset investment planning*.

They have proven our solutions within industry and have secured strong backing. In 2007, they were recognized as a "Cool Vendor" by Gartner Inc. To maintain their lead, our client needs talented, motivated people to join their team. If you enjoy a rewarding and exciting workplace where your opinions matter, and an opportunity to share in the company's success, our client may be the right place for you.

About you

You have five or more years of experience managing the implementation of enterprise-level software products in large organizations, using standard project management methodologies. You know how to coordinate teams that may include the client and third parties. You also understand the complexities (technical and people) of integrating new software and processes into an organization, and know how to work through issues to make the client successful.

You're organized, communicate well (written and orally), and work well in a team environment. You're also mobile, eligible and willing to work within Canada and the U.S.A., and be on the road approximately 50% of the time. Not in Vancouver? Your home base isn't that important, provided that you are comfortable working in a virtual office when not on the client site.

Ideally you are a PMP. Knowledge of ERP and/or EAM solutions would be useful, as understanding how asset-intensive companies plan and budget for investment. Bonus points if you are an engineer, accountant or MBA, have an understanding of the energy industry and/or electric utilities, or are familiar with the development and analysis of conservation/demand-side management programs.
